Leftmost path princi 00000 Ramsey's theorem

Determinacy 000000 Summery 000

## Motivation

There is a very large gap between  $\mathsf{ATR}_0$  and  $\Pi^1_1\text{-}\mathsf{CA}_0$  :

There are some theorems such that

- that are represented by a  $\Pi_2^1$  sentence, but
- there are only a few results on the  $\Pi^1_2$  upper bound for them.

Menger's theorem in graph theory, Nash-Williams' theorem in bqo theory and Kruskal's theorem for trees...

Question : What is the structure of  $\{\sigma \in \Pi_2^1 : \Pi_1^1 - \mathsf{CA}_0 \vdash \sigma\}$ ?

- 2 Beta reflections
- 3 Leftmost path principle
- 4 Ramsey's theorem
- 5 Determinacy

Beta reflections $000000000000000000000000000000000000$	Leftmost path principle 00000	Determinacy 000000	Summery 000

In this section, we introduce an increasing sequence of theories  $\langle T_i \rangle_i$  slicing  $\{ \sigma \in \Pi_2^1 : \Pi_1^1 \text{-} \mathsf{CA}_0 \vdash \sigma \}.$ 

## Definition

Let X be a set. The hyperjump HJ(X) of X is the set of all indices of X-computable well-ordering.

#### Fact

Any  $\Pi_1^{1,X}$  set is many-one reducible to HJ(X).

#### Definition

 $\Pi_1^1 \text{-} \mathsf{CA}_0 \text{ is } \mathsf{ACA}_0 \text{ plus } \forall X \exists Y(Y = \mathsf{HJ}(X)).$ 

Introductio 000 Beta reflections

Leftmost path princip 00000 Ramsey's theorem

Determinacy 000000 Summery 000

## $\Pi_1^1 \text{-} \mathsf{CA}_0 \text{ is } \mathsf{ACA}_0 \text{ plus } \forall X \exists Y(Y = \mathsf{HJ}(X)).$

Observation

$$\Pi_1^{1-} \mathsf{CA}_0 = \mathsf{ACA}_0 + \forall X \exists Y (Y = \mathsf{HJ}(X))$$
  
=  $\mathsf{ACA}_0 + \forall X \exists Y (Y = \mathsf{HJ}^2(X))$   
=  $\mathsf{ACA}_0 + \forall X \exists Y (Y = \mathsf{HJ}^3(X))$   
=  $\cdots$ 

Here,  $HJ^1(X) = HJ(X)$  and  $HJ^{n+1}(X) = HJ(HJ^n(X))$ .

Theorems provable from  $\Pi_1^1\text{-}\mathsf{C}\mathsf{A}_0$  should be classified into  $\mathsf{HJ}\text{-}\mathsf{level},\mathsf{HJ}^2\text{-}\mathsf{level},\mathsf{HJ}^3\text{-}\mathsf{level},\ldots$ 

```
Introduction
000
```

Leftmost path princip 00000

Ramsey's theorem

Determinacy 000000 Summery 000

#### Theorem

Let  $\theta(X, Y, Z)$  be  $\Sigma_0^1$  such that

```
\Pi_1^1 \text{-} \mathsf{CA}_0 \vdash \forall X \exists Y \forall Z \theta(X, Y, Z).
```

Then, there exists  $n \in \omega$  such that

 $\mathsf{ACA}_0 \vdash \forall X, W(W = \mathsf{HJ}^n(X) \to \exists Y \leq_{\mathrm{T}} W \forall Z \theta(X, Y, Z)))$ 

[Proof] Rewrite Montalban and Shore's work in [MoS] carefully.

Corollary (classification according to  $HJ^n$ -level)

For any  $\Pi_2^1$  sentence  $\sigma$  such that  $\Pi_1^1 \text{-} \mathsf{CA}_0 \vdash \sigma$ , there exists the smallest  $n_\sigma$  satisfying the above condition.

Introduction 000	Beta reflections $000000000000000000000000000000000000$	Leftmost path principle 00000	Ramsey's theorem	Determinacy 000000	Summery 000

- The statement  $\forall X \exists Y(Y = \mathsf{HJ}^n(X))$  is  $\Pi^1_3$ .
- We mainly focus on  $\Pi_2^1$  statements.
- We would like to introduce a nice  $\Pi_2^1$  variant of  $\forall X \exists Y (Y = \mathsf{HJ}^n(X)).$ 
  - $\rightarrow~$  We use coded  $\omega\text{-models.}$

Coded  $\omega$ -model: A structure of second-order arithmetic

- its first order part is  $\mathbb{N}$  (the same as the ground model)
- its second order part is coded by a set.

Let  $\mathcal{M} = \langle \mathcal{M}_i \rangle_i$  be a coded  $\omega$ -model. Then, for any sentence  $\sigma$  with parameters from  $\mathcal{M}$ , the condition

$$\mathcal{M} \models \sigma$$

is a  $\Sigma_1^1$  condition. Therefore, a formula of the form

 $\forall X \exists \mathcal{M}: \text{ coded } \omega \text{-model}(X \in \mathcal{M} \models \sigma)$ 

is  $\Pi_2^1$ .

Introduction	$\mathbf{Beta}$
	0000

Leftmost path princip 00000 Ramsey's theorem

Determinacy 000000 Summery 000

## $\beta_0^1 \mathsf{RFN}(n)$

 $\forall X \exists \mathcal{M}: \text{ coded } \omega \text{-model}$ 

 $(X \in \mathcal{M} \models \mathsf{ACA}_0 + \exists Y(Y = \mathsf{HJ}^n(X))).$ 

- Each  $\beta_0^1 \mathsf{RFN}(n)$  is a  $\Pi_2^1$  sentence.
- Each  $\beta_0^1 \mathsf{RFN}(n)$  is provable from  $\Pi_1^1 \mathsf{CA}_0$ .
- Over ACA<sub>0</sub>,  $\beta_0^1 \mathsf{RFN}(0) < \beta_0^1 \mathsf{RFN}(1) < \beta_0^1 \mathsf{RFN}(2) < \cdots$ .
- Each  $\sigma \in \Pi_2^1$  such that  $\Pi_1^1 \mathsf{CA}_0 \vdash \sigma$  is provable from  $\mathsf{ACA}_0 + \beta_0^1 \mathsf{RFN}(n)$  for some n.

The theories  $ACA_0 + \beta_0^1 RFN(0)$ ,  $ACA_0 + \beta_0^1 RFN(1)$ ,... slice the set  $\{\sigma \in \Pi_2^1 : \Pi_1^1 - CA_0 \vdash \sigma\}$ .

Introduction $000$	Beta reflections $000000000000000000000000000000000000$	Leftmost path principle 00000	Ramsey's theorem	Determinacy 000000	Summery 000

## The name $\beta_0^1 \mathsf{RFN}$ comes from the notion of $\beta$ -models :

#### Definition

Let  $\mathcal{M}$  be a coded  $\omega$ -model. We say  $\mathcal{M}$  is a  $\beta$ -model if it is  $\Sigma_1^1$  absolute in the sense that for any  $\Sigma_1^1$  formula  $\theta(\vec{X})$ 

$$\forall \vec{A} \in \mathcal{M}(\theta(\vec{A}) \leftrightarrow \mathcal{M} \models \theta(\vec{A}))$$

Remark :

- Coded  $\omega$ -models are  $\Sigma_0^1$  absolute.
- $[\mathcal{M} \models \theta(\vec{A})] \rightarrow \theta(\vec{A})$  is trivial.

#### Fact

Over  $ACA_0$ , for any X, TFAE.

- HJ(X) exists.
- A coded  $\beta$ -model  $\mathcal{M}$  such that  $X \in \mathcal{M}$  exists.

Therefore,  $\beta_0^1 \mathsf{RFN}(n)$  is equivalent to

 $\forall X \exists \mathcal{M}_0, \dots, \mathcal{M}_n : \text{coded } \omega \text{-models}(X \in \mathcal{M}_0 \in_\beta \dots \in_\beta \mathcal{M}_n \models \mathsf{ACA}_0).$ 

Here  $\mathcal{M}_i \in_{\beta} \mathcal{M}_{i+1}$  means that  $\mathcal{M}_i \in \mathcal{M}_{i+1}$  and  $\mathcal{M}_i$  and  $\mathcal{M}_{i+1}$  are  $\Sigma_1^1$  absolute.

Remark

- The superscript 1 is from  $[\mathcal{M}_i \text{ and } \mathcal{M}_{i+1} \text{ are } \Sigma_1^1 \text{ absolute}].$
- The subscript 0 is from  $[\mathcal{M}_n \text{ and the ground model are } \Sigma_0^1]$  absolute].

Ramsey's theore

Determinacy 000000

Summery 000

- Menger's theorem, Nash-Williams' theorem and Kruskal's theorem are  $\Pi_2^1$  statements provable from  $\Pi_1^1$  CA<sub>0</sub>.
- H. Towsner gave a  $\Pi^1_2$  upper bound.
- He used a variant of leftmost path principle.

### Leftmost Path Principle

```
TFAE over ACA_0:
```

- $\Pi_1^1 CA_0$ ,
- any ill-founded tree  $T \subseteq \mathbb{N}^{<\mathbb{N}}$  has a leftmost path (w.r.t. the lexicographical order).

Towsner introduced a restricted *leftmost-ness*.

Introduction Beta 000 000 Leftmost path principle 00000

Ramsey's theorem

Determinacy 000000

Summery 000

Let T be a tree,  $f \in [T]$  and  $\alpha$  be a well-order.

The path f is a  $\Delta^0_{\alpha}$ -leftmost path if

$$\forall g \in [T] (g \leq_T f^{(\alpha)} \to f \leq_l g).$$

The path f is leftmost in  $[T] \cap \Delta^{0,f}_{\alpha}$ .

- $\Delta^0_{\alpha}$ LPP: any ill-founded tree has a  $\Delta^0_{\alpha}$ -leftmost path.
- TLPP:  $\forall \alpha(WO(\alpha) \rightarrow \Delta^0_{\alpha} LPP).$

#### Theorem (Towsner)

- $\mathsf{ATR}_0 \leq \Delta_0^0 \mathsf{LPP} < \mathsf{TLPP}$  and
- MT and NWT are provable from TLPP,
- KT is provable from  $\Delta_2^0 LPP$ .

Beta reflections 0000000000	Leftmost path principle $0000\Phi$	Ramsey's theorem	Determinacy 000000	Summery 000

## How strong are $\Delta_2^0 \mathsf{LPP}$ and $\mathsf{TLPP}$ in $\{\sigma \in \Pi_2^1 : \Pi_1^1 - \mathsf{CA}_0 \vdash \sigma\}$ ?

Theorem

Over  $ACA_0$ ,

 $\mathsf{ATR}_0 < \Delta_2^0 \mathsf{LPP} < \beta_0^1 \mathsf{RFN}(1) = \mathsf{ALPP} < \mathsf{TLPP} < \beta_0^1 \mathsf{RFN}(2).$ 

Here, ALPP is a variant of TLPP.

- Some fragments of Galvin-Prikry's theorem  $(\Sigma_2^0 \mathsf{Ram}, \Sigma_3^0 \mathsf{Ram}...)$  are equivalent to  $\Pi_1^1$   $\mathsf{CA}_0$ .
  - The hierarchy of  $\Sigma_n^0 \mathsf{Ram}$  collapses in reverse math.
- From the viewpoint of computability,  $\Sigma_2^0 Ram, \Sigma_3^0 Ram...$  should be separated.
- Comparing  $\beta_0^1 \mathsf{RFN}$ -hierarchy and  $\Sigma_n^0 \mathsf{Ram}$ -hierarchy, we can say the latter is strict in a sense.

Introduction Beta reflections Leftmost path print 000 00000000 00000 Ramsey's theorem

Determinacy 000000 Summery 000

## Definitions :

- $[X]^{\mathbb{N}}$ : the set of infinite subsets of X.
- $\mathcal{A} \subseteq [\mathbb{N}]^{\mathbb{N}}$  has the Ramsey property if there exists a set  $H \in [\mathbb{N}]^{\mathbb{N}}$  such that

$$[H]^{\mathbb{N}} \subseteq \mathcal{A} \vee [H]^{\mathbb{N}} \cap \mathcal{A} = \emptyset.$$

#### Fact

Over  $ACA_0$ , TFAE.

- $\Pi^1_1$  CA<sub>0</sub>.
- Any  $\Sigma_2^0$  definable class has the Ramsey property  $(\Sigma_2^0 \mathsf{Ram})$ .
- Any  $\Sigma_0^1$  definable class has the Ramsey property  $(\Sigma_0^1 \mathsf{Ram})$ .

Introduction Be 000 00 Leftmost path principl 00000 Ramsey's theorem 000000

Determinacy 000000 Summery 000

#### Definition (arithmetical reduction)

Let X, Y be sets. We write  $X \leq_{\mathrm{T}}^{\mathrm{a}} Y$  if  $\exists n(X \leq_{\mathrm{T}} Y^{(n)})$ .

We say  $\mathcal{A}$  has the relative Ramsey property if there exists  $H \in [\mathbb{N}]^{\mathbb{N}}$  such that

$$([H]^{\mathbb{N}} \cap \{G : G \leq_{\mathrm{T}}^{\mathrm{a}} H\}) \subseteq \mathcal{A} \lor$$
$$([H]^{\mathbb{N}} \cap \{G : G \leq_{\mathrm{T}}^{\mathrm{a}} H\}) \cap \mathcal{A} = \varnothing.$$

#### Definition $(\operatorname{rel}(\Sigma_i^i \mathsf{Ram}))$

Any  $\Sigma_{i}^{i}$  definable class has the relative Ramsey property.

Beta reflections 0000000000	Leftmost path principle 00000	Ramsey's theorem 0000€0	Summery 000

#### Theorem

Over  $ACA_0$ ,

- $\beta_0^1 \mathsf{RFN}(n)$  proves  $\operatorname{rel}(\Sigma_n^0 \mathsf{Ram})$  for n > 0.
- $\operatorname{rel}(\Sigma_{2n}^0\mathsf{Ram})$  proves  $\beta\mathsf{RFN}(n)$  for n > 0.

Although the  $\Sigma_n^0 \mathsf{Ram}$  hierarchy collapses, the  $\operatorname{rel}(\Sigma_n^0 \mathsf{Ram})$  hierarchy does not.

#### Remark

This result reflects a computability theoretic intuition that [a homogeneous set for  $(\Sigma_n^0 Ram)$  is computable from the *n*-th hyperjump].

Introduction 000	Beta reflections 0000000000	Leftmost path principle 00000	Ramsey's theorem $00000$	Determinacy 000000	Summery 000

#### Remark

The last result probably be improved as follows: Over  $\mathsf{ACA}_0,$ 

 $\beta_0^1 \mathsf{RFN}(n) \leftrightarrow \operatorname{rel}(\Sigma_n^0).$ 

(Cf. A. Marcone and G. Marco, "The Galvin-Prikry theorem in the Weihrauch lattice", to appear.)

Let  $\mathcal{A} \subseteq \mathbb{N}^{\mathbb{N}}$ . Consider the following two players game  $G_{\mathcal{A}}$ :

- **1** Let n = 0.
- **2** Player 0 plays  $x_{2n} \in \mathbb{N}$ .
- **3** Player 1 plays  $x_{2n+1} \in \mathbb{N}$ .
- **(**) Increment n and return to step 2.
- After  $\omega$ -steps this game yields a sequence  $(x_i)_i \in \mathbb{N}^{\mathbb{N}}$ .

Player 0 wins  $G_{\mathcal{A}}$  iff  $(x_i)_i \in \mathcal{A}$ .

## 

Definitions :

- A function  $S: \mathbb{N}^{<\mathbb{N}} \to \mathbb{N}$  is called a strategy.
- For strategies S, S', a sequence  $(x_i)_i$  is the play along S, S' $((x_i)_i = S \otimes S')$  if

$$x_{2i} = S(x_0, \dots, x_{2i-1})$$
 and  $x_{2i+1} = S'(x_0, \dots, x_{2i})$ .

- A strategy S is a winning strategy for 0 in  $G_{\mathcal{A}}$  if for any strategy  $S', S \otimes \overline{S'} \in \mathcal{A}$ .
- A strategy S' is a winning strategy for 1 in  $G_{\mathcal{A}}$  if for any strategy  $S, S \otimes \overline{S'} \notin \mathcal{A}$ .
- $\underline{\mathcal{A}}$  is determined if  $G_{\mathcal{A}}$  has a winning strategy.
